Introduction

- Code-switching - the use of more than one language within the same communicative episode - is common among bilingual signers [1-4]
- One particular kind of code-switching, known as reiteration, is common in sign language contact situations [6], and it constitutes 30% of our dataset
- Reiterative code-switching is when semantically equivalent signs are produced in both languages sequentially, e.g., WOMAN WOMAN (see Fig. 1)
- Some researchers claim that code-switching can lead to borrowing [8,10,11] - the adoption of individual words or even large sets of vocabulary items from another language or dialect [9]

Fig. 1: example of reiteration

- Difficulty?** Deciding whether a single-sign switch is an example of a code-switch or a borrowed sign is difficult in any language [13,19]
- Some criteria have been suggested in the spoken language literature, including:
 - Integration: changes to make borrowed words fit in recipient language [19]
 - Diffusion: recurrent use across signers [11,17]
 - Recurrence: recurrent use within individuals [11,17]

Methodology & Community Under Investigation

- In Kufri Qassem (see Fig. 2), younger deaf people are exposed to two sign languages, Kufri Qassem Sign Language (KQSL) and Israeli Sign Language (ISL)
- Participants were filmed in pairs with a matched signer and asked to retell a Charlie Chaplin clip
- Lexical signs from each sign language were decided based on dictionary entries & consultation with native signers within each community
- Switches were counted when the signer switched to their non-dominant language.
- Monolingual ISL signers serve as a baseline

Table 1: Languages in contact

| Israeli Sign Language (ISL) | Kufri Qassem Sign Language (KQSL) |
|--|---|
| Larger heterogeneous population (15) | Smaller homogeneous population (14) |
| Used by ~10,000 people (12) | Used by ~100 deaf & hearing people (12) |
| Dominant sign language used within media, education & interpreting | Isolated until relatively recently (12) |
| Population: Roughly 8 Million (16) | Population: Roughly 23,000 (16) |

Fig. 2: Map of Israel

Table 2: Participants

| Groups | N | Age range |
|----------------------------|---|-----------|
| Monolingual ISL (baseline) | 6 | 22-54 |
| Monolingual KQSL | 6 | 39-67 |
| Bilingual (KQSL/ISL) | 6 | 21-42 |

Research Question

- Is the use of reiteration an example of code-switching or borrowing in Kufri Qassem?

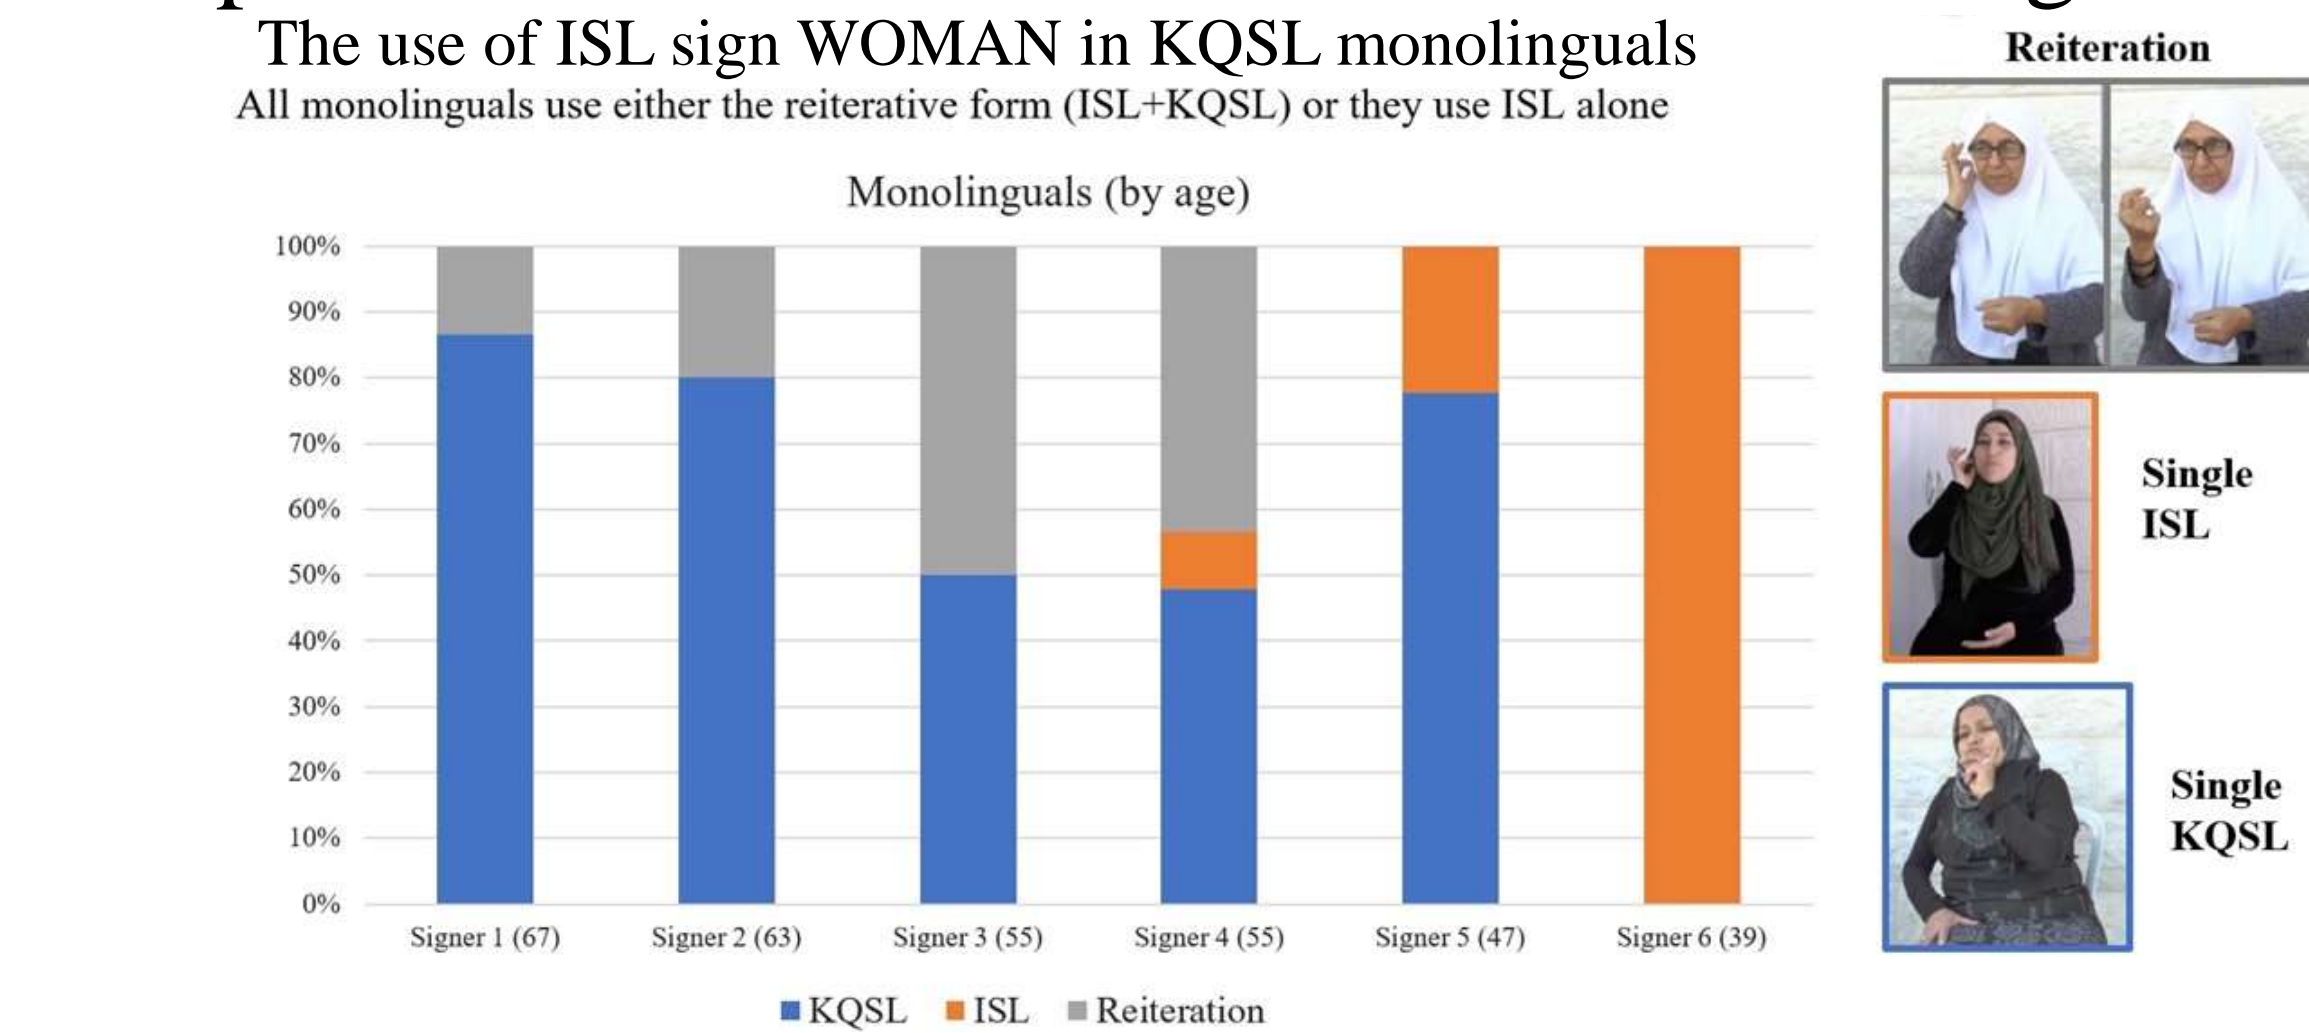

Results

Graph 1: Lexical Signs Division across groups

- Drastic change in language use within Kufri Qassem deaf community appears in bilinguals dominant use of ISL
- Surprisingly, KQSL monolinguals switch to ISL 15% of their sign production

Graph 2: Recurrence and Diffusion: Borrowing

- The use of the ISL sign "WOMAN" is diffused across all 6 KQSL monolinguals, whether in reiteration (ISL+KQSL) or the ISL sign on its own
- The ISL sign "WOMAN" recurs within individuals' discourse

Discussion: The Case of the Married One

Table 3: defining feature of code-switching and borrowing

| Code-switching vs Borrowing | Our Results |
|---|-------------|
| Borrowed words become integrated | ✓ |
| Borrowed words recur within individuals | ✓ |
| Borrowed words recur across individuals | ✓ |
| Borrowed words are used by monolinguals | ✓ |

- When we look at the example below, we see that KQSL has a compound sign 'MAN+WOMAN' translated as 'the married one'
- Over time, the compound components have changed, 'WOMAN+WOMAN', 'MAN+MAN'
- Signers retain the compound template and, through increased contact with ISL, borrow in the ISL form to fill each compound slot

- Reiteration appears to be an example of borrowing of ISL into KQSL's existing compound, rather than code-switching, unlike in other studies (6)

Evidence?

- Integration of the ISL form into the KQSL compound template serves as a good indicator of borrowing
- Recurrence and diffusion of ISL sign for "WOMAN" across all KQSL monolinguals are another two pieces of evidence of borrowing

Conclusions

- Sign languages offer us a different perspective on code-switching
- What appears to be an obvious code-switching instance, may in fact be something else because sign languages behave differently to spoken languages
- In this study, the behaviours of monolinguals and the presence of integration are important indicators of whether a single-sign switch is code-switching or borrowing

The Case of "The Married One" Sign** as an Example of ISL Borrowing into KQSL

Fig. 3 - original form of the "married one" sign

- Women of a certain age are referred to as 'the married one' in KQSL
- This concept is represented by the compound sign: MAN+WOMAN
- KQSL has several coexisting variants for WOMAN and MAN, and signers select a variant to fill compound slot

- Over time, this changed to become more explicit
- Wives were referred to with the signs WOMAN+WOMAN and husbands with the signs MAN+MAN

Fig. 4 - 2nd generation change of the "married one" sign

Fig. 5 - ISL sign "WOMAN" borrowing into "the married one" compound

- Increased contact with ISL leads to borrowing
- The ISL sign for WOMAN fills one of the compound slots

**Used by 50% of KQSL monolinguals

Take-Home Message

- Reiterative "code-switching" is not always code-switching!
