# THE UNIVERSITY OF TFXAS AT AUSTIN

# Can the Comparative Method be used for signed language historical analyses?

Justin M. Power\*, David Quinto-Pozos, Danny Law

#### What is the Comparative Method?

• The CM is an analytical toolkit used by historical linguists to make historical inferences about contemporary languages known to be related.

What are recurring correspondences?

Grimm's Law:

- Many words with voiceless stops p, t, k (e.g., in Greek and Latin; see Table 1) have corresponding words (with the same meaning) in Germanic languages: (p:f, t:θ, and k:h).
- The correspondences **recur systematically**, i.e., they are found repeatedly throughout the vocabularies of these languages in definable phonetic environments.

Table 1. Selected recurring correspondences from Grimm's Law

		Germanic		
Greek	Latin	Gothic	English	
<b>p</b> atér	<b>p</b> atēr	fadar	father	
phrá <b>t</b> ēr	frā <b>t</b> er	brō <b>þ</b> ar	bro <b>th</b> er	
<b>k</b> úōn	<b>c</b> anis [k]	hunds	hound	

## Why has the Comparative Method never been applied to sign languages?

- Insufficient data:<sup>2</sup> no open historical comparative databases with transcribed signs exist.
- No systematic correspondences: scholars have identified patterns in diachronic change,<sup>3</sup> but systematic correspondences have yet to be identified among any putative sign family.
- **Corresponding units in sign language**: Segments are compared in spoken languages. It is not evident which units should be compared for sign languages.
- The CM assumes that sound change can be regular, resulting in systematic correspondences; but it is not known whether this holds for sign languages.

Fig. 1. Simplified tree of Indo-European adapted from Ringe et al. 2002.<sup>1</sup>

Data aggregation

Recurring correspondences provide proof of cognacy, evidence of sound changes, allowing reconstruction of ancestral forms, and evidence for subgrouping related languages based on shared innovations, such as  $p \rightarrow f$ ,  $t \rightarrow \theta$ ,  $k \rightarrow h$ .

Here, we report initial results from an ongoing project applying the CM to transcribed sign data from the putative French sign family.

Transcription

Table 2 shows the six sign languages included in this study with sources of data. Languages were chosen because of claims about relatedness in a potential French sign language family.<sup>4</sup>

#### Table 2. Languages in the dataset and sources of videos.

Language	Source			
American Sign Language (ASL)	asl-lex.org, spreadthesign.com			
Langue des signe de Belgique Francophone (LSBF)	dicto.lsfb.be			
La lengua de señas mexicana (LSM)	Data collected by Quinto-Pozos, spreadthesign.com			
Langue des signes française (LSF)	spreadthesign.com, sematos.eu/lsf.html			
Língua de Sinais Brasileira (Libras)	idsinais.libras.ufsc.br, ines.gov.br/dicionario-de-libras			
$\lambda/l_{0}$ are a Calcoverte al $(\lambda/CT)$				

- 284 total signs, forming 37 putative cognate sets, were transcribed using HamNoSys.<sup>5</sup>
- Target: comparing 207 sets using basic vocabulary list.<sup>6</sup>

Table 3. Transcription in HamNoSys of the LSM sign meaning 'good'. Sign language Concept Handshape Orientation Location Movement  $(X_{234}) \qquad (N_{237})$ LSM good 🕞 🕞 🖓

to the 37 total putative cognate sets.

#### Putative cognate sets

Organize transcribed signs into putative cognate sets based on meaning (i.e., not considering form), including all sign variants.

Table 4. Putative cognate sets for the meanings 'good', 'hard' (pictured above), and 'new'.

Language	Concept	Handshape	Orientation	Location	Movement
ASL	good	$\bigcirc$	r 0		
Libras	good	$\Diamond$	r 0	ອ)(	[ ♠ >>> ₩]
VGT	good	$\bigcirc$	<b>r</b> 0	( X <sub>2 3 </sub> ∎)	
LSF	good	$\overline{\diamond}$	<u>^0</u>	چ <sup>( (</sup> <sup>(</sup> <sup>2</sup> <sup>3</sup> <sup>4</sup> <sup>(</sup>	$[\overset{\circ}{\vdash}  \widetilde{\mathbb{M}}]$
LSM	good	$\bigcirc$	<b>r</b> 0		
ASL	hard	<b>.</b> (1)	<b>∧</b> 0		[↓_∞]
Libras	hard	[] <sub>/</sub> ]		_~( X 2 □)	$[ + + + \underset{\neq}{\otimes}]$
VGT	hard	<b>.</b> ()	<b>∧</b> 0	<sub>2</sub> (X <sub>2</sub> )	[↓_∅]
LSF	hard			_ ( X <sub>3 □</sub> )	$[ + + \bigotimes_{\neq} \bigotimes]$
LSFB	hard	: (		$\begin{bmatrix} 2 & 1 \end{bmatrix} \xrightarrow{(\chi_2)} \begin{bmatrix} 1 & 2 \end{bmatrix} \xrightarrow{(\chi_2)}  \begin{bmatrix} 2 & 1 \end{bmatrix}$	[№(X <sub>2</sub> ]) <sub>≠</sub> ∅]
LSM	hard		[ ~0~~]	<u>, ()</u> 3 <u>6</u> , )	[↓_∅]
ASL	new	[\$\overline\$_1]		[(	[[ < < ( , )] - ]
Libras	new	$\Diamond$	r 0		[←≻→∭]
VGT	new		[]		[∠ <sub>≻→∭,</sub> ∅]
LSF	new			[( ) <u>[</u> ) _ <del>[</del> ]	$[[\uparrow(\downarrow_{\mathcal{I}})) \to \widehat{\mathbb{H}}_{\mathcal{I}}]_{\mathcal{I}} \otimes ]$
LSFB	new			[ ~( ) <sup>~</sup> ] <u>_</u> ]	$[[\leftarrow(\dagger_{\frown})) \rightarrow \widehat{\mathbb{W}}_{2}] \rightarrow ]$

#### **Correspondence patterns**

List correspondences: Correspondences can be simple lists of parameters for each meaning comparison (e.g., a list of handshapes for each language per meaning); or they can be lists of other phonological details, as in the comparisons of aperture ("open" or "closed" handshapes) or contact in Table 5.

Language splits show how languages pattern together for each correspondence identified. Notice that the correspondence patterns in Table 5 do not recur.

#### What types of recurring correspondences do we expect to find?

- Unconditioned: In all contexts, one parameter (e.g., handshape) corresponds to another e.g., □:
- Conditioned: Parameters or features correspond in definable contexts e.g.,  $\bigcirc$ :  $\diamond$  only in 1-handed signs

Table 5. Selected correspondence patterns identified using data in Table 4.

Concept	Parameter	Correspondence	ASL	Libras	VGT	LSF	LSFB	LSM	Language split	
good	Handshape	open ( $\bigcirc$ ) : closed ( $\lhd$ )	$\bigcirc$	0	$\bigcirc$	-	?	$\bigcirc$	ASL, VGT, LSM	Libras, LSF
new	Handshape	open (₯) : closed (๙/✑)	Ō	0	Q	0	0	( Ø	ASL	Libras, VGT, LSF, LSFB, LSM
new	Location	Contact back no (0) : yes (1)	0	-	0	0	1	0	ASL, VGT, LSF, LSM	LSFB
hard	Location	Contact back no (0) : yes (1)	0	1	0	1	1	1	ASL, VGT	Libras, LSF, LSFB, LSM
new	Symmetry	no (0) : yes (1)	1	-	0	0	1	0	ASL, LSFB	VGT, LSF, LSM
hard	Symmetry	no (0) : yes (1)	1	0	1	0	1	0	Libras, LSF, LSM	ASL, VGT, LSFB
good	Movement	HS no change (0) : change (1)	0	1	0	1	?	0	ASL, VGT, LSM	Libras, LSF

# **Preliminary conclusions**

<u>ר</u>ס∠|ז0

new

LSM

Based on our preliminary analysis of 284 signs, **no** correspondences are clearly regular or recurring in the dataset.

[\_\_( ( , \_\_)\_∠⊟]

 $[\uparrow(\downarrow_{\downarrow})_{\to} \underbrace{(\downarrow_{\downarrow})_{\downarrow}}_{\downarrow}]$ 

- Why have we yet to find examples of recurring correspondences?
- Larger dataset: If horizontal evolutionary processes (e.g., borrowing, iconicity) predominate in the development of these languages, regular correspondences may exist but may be difficult to detect in a small dataset.
- Transcribed data from other putative language families: Regular change may be more prevalent in the development of other sign language families.
- Methods for detecting results of horizontal processes must be adapted / developed for sign research.

#### **Theoretical relevance**

The CM is presumed to be **universally applicable** because all (spoken) languages are presumed to undergo regular (sound) change.<sup>7</sup> Because we have not yet found the predicted results of regular change in sign languages in this exploratory study, the question remains open as to whether there is a sign language parallel to regular sound change.
